Within the framework of a local $SU(3)$ family symmetry model, we report a general analysis of the mechanism for neutrino mass generation and mixing, including light sterile neutrinos. In this scenario, ordinary heavy fermions, top and bottom quarks and tau lepton, become massive at tree level from Dirac See-saw mechanisms implemented by the introduction of a new set of $SU(2)_L$ weak singlet vector-like fermions, U, D, E, N , with N a sterile neutrino. Right-handed and the $N_{L,R}$ sterile neutrinos allow the implementation of a 8×8 general Majorana neutrino mass matrix with four or five massless neutrinos at tree level. Hence, light fermions, including light neutrinos get masses from radiative corrections mediated by the massive $SU(3)$ gauge bosons. We report the corresponding Majorana neutrino mass matrix up to one loop. Previous numerical analysis of the free parameters show out solutions for quarks and charged lepton masses within a parameter space region where the vector-like fermion masses M_U, M_D, M_E , and the $SU(3)$ family gauge boson masses lie in the low energy region of $\mathcal{O}(1-20)$ TeV, with light neutrinos within the correct order of square neutrino mass differences: $m_2^2 - m_1^2 \approx 7 \times 10^{-5} \text{ eV}^2$, $m_3^2 - m_1^2 \approx 2 \times 10^{-3} \text{ eV}^2$, and at least one sterile neutrino of the order $\approx 0.5 \text{ eV}$. A more precise fit of the parameters is still needed to account also for the quark and lepton mixing.

I. INTRODUCTION

Although the standard picture with three light flavor neutrinos has been successful to describe the neutrino oscillation data. On the other hand, there have been recent hints from the LSND and MiniBooNe short-baseline neutrino oscillation experiments[1, 2] on the possible existence of at least one light sterile neutrino in the eV scale, which mix with the active neutrinos. On the other hand, an explanation of the strong hierarchy of quark and charged lepton masses is still a big challenge in particle physics. This hierarchy have suggested to many model building theorists that light fermion masses could be generated from radiative corrections, while those of the top and bottom quarks and the tau lepton are generated at tree level. This may be understood as the breaking of a symmetry among families , a horizontal symmetry.

In this report we update the general features of a "Beyond the Standard Model"(BSM) proposal which introduces a $SU(3)$ [3] gauged family symmetry¹ commuting with the Standard Model group. Previous reports[4] within this scenario showed that this model has the features and particle content to account for a realistic spectrum of charged fermion masses and quark mixing. This BSM model introduce a hierarchical mass generation mechanism in which the light fermions obtain masses through one loop radiative corrections, mediated by the massive bosons associated to the $SU(3)$ family symmetry that is spontaneously broken, while the masses for the top and bottom quarks as well as for the tau lepton, are generated at tree level from "Dirac See-saw"[5] mechanisms implemented by the introduction of a new generation of $SU(2)_L$ weak singlets vector-like fermions.

The $SU(3)$ family symmetry model allows one to address the problem of quark and lepton masses and mixing, including active and light sterile neutrinos.

II. $SU(3)$ FLAVOR SYMMETRY MODEL

A. Fermion content

Before "Electroweak Symmetry Breaking"(EWSB) all ordinary, "Standard Model"(SM) fermions remain massless, and the global symmetry in this limit of all quarks and leptons massless, including R-handed neutrinos, is:

$$SU(3)_{q_L} \otimes SU(3)_{u_R} \otimes SU(3)_{d_R} \otimes SU(3)_{l_L} \otimes SU(3)_{\nu_R} \otimes SU(3)_{e_R} \quad (1)$$

$$\supset SU(3)_{q_L+u_R+d_R+l_L+e_R+\nu_R} \equiv SU(3) \quad (2)$$

We define the gauge group symmetry $G \equiv SU(3) \otimes G_{SM}$, where Eq.(2) defines the $SU(3)$ gauged family symmetry, and $G_{SM} \equiv SU(3)_C \otimes SU(2)_L \otimes U(1)_Y$ is the "Standard Model" gauge group, with g_H, g_s, g and g' the corresponding coupling constants. The content of fermions assumes the ordinary quarks and leptons assigned under G as:

$$\psi_q^o = (3, 3, 2, \frac{1}{3})_L \quad , \quad \psi_u^o = (3, 3, 1, \frac{4}{3})_R \quad , \quad \psi_d^o = (3, 3, 1, -\frac{2}{3})_R$$

$$\psi_l^o = (3, 1, 2, -1)_L \quad , \quad \psi_e^o = (3, 1, 1, -2)_R \quad ,$$

where the last entry corresponds to the hypercharge Y , and the electric charge is defined by $Q = T_{3L} + \frac{1}{2}Y$. The model also includes two types of extra fermions:

- Right handed neutrinos $\Psi_\nu^o = (3, 1, 1, 0)_R$ required to cancel anomalies[6], and
- the $SU(2)_L$ singlet vector-like fermions:

¹ See [3, 4] and references therein for some $SU(3)$ family symmetry models.

$$U_{L,R}^o = (1, 3, 1, \frac{4}{3}) \quad , \quad D_{L,R}^o = (1, 3, 1, -\frac{2}{3}) \quad (3)$$

$$N_{L,R}^o = (1, 1, 1, 0) \quad , \quad E_{L,R}^o = (1, 1, 1, -2) \quad (4)$$

which conserve the previous anomaly cancellation. The transformation of these vector-like fermions allows the mass invariant mass terms

$$M_U \bar{U}_L^o U_R^o + M_D \bar{D}_L^o D_R^o + M_E \bar{E}_L^o E_R^o + h.c. \quad , \quad (5)$$

and

$$m_D \bar{N}_L^o N_R^o + m_L \bar{N}_L^o (N_L^o)^c + m_R \bar{N}_R^o (N_R^o)^c + h.c \quad (6)$$

These $SU(2)_L$ weak singlets vector-like fermions have been introduced to give masses at tree level only to the third family of known fermions through Dirac See-saw mechanisms. M_U, M_D, M_E play a crucial role to implement a hierarchical spectrum for quarks and charged lepton masses and mixing, meanwhile m_D, m_L, m_R play a similar role for neutrino masses and lepton mixing, all together with the radiative corrections.

III. $SU(3)$ FAMILY SYMMETRY BREAKING

The corresponding $SU(3)$ gauge bosons are defined through their couplings to fermions as

$$i\mathcal{L}_{int} = \frac{g_H}{2} (\bar{f}_1^o \gamma_\mu f_1^o - \bar{f}_2^o \gamma_\mu f_2^o) Z_1^\mu + \frac{g_H}{2\sqrt{3}} (\bar{f}_1^o \gamma_\mu f_1^o + \bar{f}_2^o \gamma_\mu f_2^o - 2\bar{f}_3^o \gamma_\mu f_3^o) Z_2^\mu \\ + \frac{g_H}{\sqrt{2}} (\bar{f}_1^o \gamma_\mu f_2^o Y_1^+ + \bar{f}_1^o \gamma_\mu f_3^o Y_2^+ + \bar{f}_2^o \gamma_\mu f_3^o Y_3^+ + h.c.) \quad (7)$$

$f_1^o = u^o, d^o, e^o, \nu_e^o$, $f_2^o = c^o, s^o, \mu^o, \nu_\mu^o$ and $f_3^o = t^o, b^o, \tau^o, \nu_\tau^o$. To implement a hierarchical spectrum for charged fermion masses, and simultaneously to achieve the SSB of $SU(3)$, we introduce the flavon scalar fields: $\eta_i = (3, 1, 1, 0)$, $i = 1, 2, 3$, transforming as the fundamental representation under $SU(3)$ and being standard model singlets, with the "Vacuum Expectation Values" (VEV's):

$$\langle \eta_1 \rangle^T = (\Lambda_1, 0, 0) \quad , \quad \langle \eta_2 \rangle^T = (0, \Lambda_2, 0) \quad , \quad \langle \eta_3 \rangle^T = (0, 0, \Lambda_3) \quad (8)$$

Actually, let us point out here that only two scalar flavons in the fundamental representation are needed to completely break down the $SU(3)$ symmetry. The most convenient way to accomplish the spontaneous breaking of the $SU(3)$ family symmetry is under study. Thus, the contribution to the horizontal gauge boson masses from Eq.(8) read

- η_1 : $\frac{g_{H_1}^2 \Lambda_1^2}{2} (Y_1^+ Y_1^- + Y_2^+ Y_2^-) + \frac{g_{H_1}^2 \Lambda_1^2}{4} (Z_1^2 + \frac{Z_2^2}{3} + 2Z_1 \frac{Z_2}{\sqrt{3}})$
- η_2 : $\frac{g_{H_2}^2 \Lambda_2^2}{2} (Y_1^+ Y_1^- + Y_3^+ Y_3^-) + \frac{g_{H_2}^2 \Lambda_2^2}{4} (Z_1^2 + \frac{Z_2^2}{3} - 2Z_1 \frac{Z_2}{\sqrt{3}})$
- η_3 : $\frac{g_{H_3}^2 \Lambda_3^2}{2} (Y_2^+ Y_2^- + Y_3^+ Y_3^-) + g_{H_3}^2 \Lambda_3^2 \frac{Z_2^2}{3}$

Therefore, neglecting tiny contributions from electroweak symmetry breaking, we obtain the gauge boson mass terms

$$(M_1^2 + M_2^2) Y_1^+ Y_1^- + (M_1^2 + M_3^2) Y_2^+ Y_2^- + (M_2^2 + M_3^2) Y_3^+ Y_3^- \\ + \frac{1}{2} (M_1^2 + M_2^2) Z_1^2 + \frac{1}{2} \frac{M_1^2 + M_2^2 + 4M_3^2}{3} Z_2^2 + \frac{1}{2} (M_1^2 - M_2^2) \frac{2}{\sqrt{3}} Z_1 Z_2 \quad (9)$$

	Z_1	Z_2
Z_1	$M_1^2 + M_2^2$	$\frac{M_1^2 - M_2^2}{\sqrt{3}}$
Z_2	$\frac{M_1^2 - M_2^2}{\sqrt{3}}$	$\frac{M_1^2 + M_2^2 + 4M_3^2}{3}$

TABLE I: $Z_1 - Z_2$ mixing mass matrix

$$M_1^2 = \frac{g_{H_1}^2 \Lambda_1^2}{2} \quad , \quad M_2^2 = \frac{g_{H_2}^2 \Lambda_2^2}{2} \quad , \quad M_3^2 = \frac{g_{H_3}^2 \Lambda_3^2}{2} \quad (10)$$

From the diagonalization of the $Z_1 - Z_2$ squared mass matrix, we obtain the eigenvalues

$$\begin{aligned} M_-^2 &= \frac{2}{3} \left(M_1^2 + M_2^2 + M_3^2 - \sqrt{(M_2^2 - M_1^2)^2 + (M_3^2 - M_1^2)(M_3^2 - M_2^2)} \right) \\ M_+^2 &= \frac{2}{3} \left(M_1^2 + M_2^2 + M_3^2 + \sqrt{(M_2^2 - M_1^2)^2 + (M_3^2 - M_1^2)(M_3^2 - M_2^2)} \right) \\ M_{Y_1}^2 &Y_1^+ Y_1^- + M_{Y_2}^2 Y_2^+ Y_2^- + M_{Y_3}^2 Y_3^+ Y_3^- + M_-^2 \frac{Z_-^2}{2} + M_+^2 \frac{Z_+^2}{2} \end{aligned} \quad (11)$$

where

$$M_{Y_1}^2 = M_1^2 + M_2^2 \quad , \quad M_{Y_2}^2 = M_1^2 + M_3^2 \quad , \quad M_{Y_3}^2 = M_2^2 + M_3^2 \quad (12)$$

$$\begin{pmatrix} Z_1 \\ Z_2 \end{pmatrix} = \begin{pmatrix} \cos \phi & -\sin \phi \\ \sin \phi & \cos \phi \end{pmatrix} \begin{pmatrix} Z_- \\ Z_+ \end{pmatrix} \quad (13)$$

$$\cos \phi \sin \phi = \frac{\sqrt{3}}{4} \frac{M_1^2 - M_2^2}{\sqrt{(M_2^2 - M_1^2)^2 + (M_3^2 - M_1^2)(M_3^2 - M_2^2)}} ,$$

with Z_- , Z_+ the mass eigenfields², and the hierarchy $M_1, M_2, M_3 \gg M_W$. Due to the $Z_1 - Z_2$ mixing we diagonalize the propagators involving Z_1 and Z_2 gauge bosons according to Eq.(13):

$$Z_1 = \cos \phi Z_- - \sin \phi Z_+ \quad , \quad Z_2 = \sin \phi Z_- + \cos \phi Z_+$$

$$\langle Z_1 Z_1 \rangle = \cos^2 \phi \langle Z_- Z_- \rangle + \sin^2 \phi \langle Z_+ Z_+ \rangle$$

$$\langle Z_2 Z_2 \rangle = \sin^2 \phi \langle Z_- Z_- \rangle + \cos^2 \phi \langle Z_+ Z_+ \rangle$$

$$\langle Z_1 Z_2 \rangle = \cos \phi \sin \phi (\langle Z_- Z_- \rangle - \langle Z_+ Z_+ \rangle)$$

² Notice that in the limit $M_1^2 = M_2^2$; $\sin \phi = 0$, $\cos \phi = 1$

IV. ELECTROWEAK SYMMETRY BREAKING

Recently ATLAS[7] and CMS[8] at the Large Hadron Collider announced the discovery of a Higgs-like particle, whose properties, couplings to fermions and gauge bosons will determine whether it is the SM Higgs or a member of an extended Higgs sector associated to a BSM theory. The electroweak symmetry breaking in the $SU(3)$ family symmetry model involves the introduction of two triplets of $SU(2)_L$ Higgs doublets.

To achieve the spontaneous breaking of the electroweak symmetry to $U(1)_Q$, we introduce the scalars: $\Phi^u = (3, 1, 2, -1)$ and $\Phi^d = (3, 1, 2, +1)$, with the VEVs:

$$\langle \Phi^u \rangle = \begin{pmatrix} \langle \Phi_1^u \rangle \\ \langle \Phi_2^u \rangle \\ \langle \Phi_3^u \rangle \end{pmatrix}, \quad \langle \Phi^d \rangle = \begin{pmatrix} \langle \Phi_1^d \rangle \\ \langle \Phi_2^d \rangle \\ \langle \Phi_3^d \rangle \end{pmatrix}, \quad (14)$$

$$\langle \Phi_i^u \rangle = \frac{1}{\sqrt{2}} \begin{pmatrix} v_{ui} \\ 0 \end{pmatrix}, \quad \langle \Phi_i^d \rangle = \frac{1}{\sqrt{2}} \begin{pmatrix} 0 \\ v_{di} \end{pmatrix}, \quad (15)$$

contribute to the W and Z boson masses:

$$\frac{g^2}{4} (v_u^2 + v_d^2) W^+ W^- + \frac{(g^2 + g'^2)}{8} (v_u^2 + v_d^2) Z_o^2$$

$v_u^2 = v_{u1}^2 + v_{u2}^2 + v_{u3}^2$, $v_d^2 = v_{d1}^2 + v_{d2}^2 + v_{d3}^2$. Hence, if we define $M_W = \frac{1}{2} g v$, we may write $v = \sqrt{v_u^2 + v_d^2} \approx 246$ GeV.

V. TREE LEVEL NEUTRINO MASSES

Now we describe briefly the procedure to get the masses for ordinary fermions. The analysis for quarks and charged leptons has already discussed in [4]. Here, we introduce the procedure for neutrinos.

A. Tree level Dirac neutrino masses

With the fields of particles introduced in the model, we may write the Dirac type gauge invariant Yukawa couplings

$$h_D \bar{\Psi}_l^o \Phi^u N_R^o + h_1 \bar{\Psi}_\nu^o \eta_1 N_L^o + h_2 \bar{\Psi}_\nu^o \eta_2 N_L^o + h_3 \bar{\Psi}_\nu^o \eta_3 N_L^o + M_D \bar{N}_L^o N_R^o + h.c. \quad (16)$$

h_D, h_1, h_2 and h_3 are Yukawa couplings, and M_D a Dirac type, invariant neutrino mass for the sterile neutrinos $N_{L,R}^o$. After electroweak symmetry breaking, we obtain in the interaction basis $\Psi_{\nu L,R}^{oT} = (\nu_e^o, \nu_\mu^o, \nu_\tau^o, N^o)_{L,R}$, the mass terms

$$h_D [v_1 \bar{\nu}_{eL}^o + v_2 \bar{\nu}_{\mu L}^o + v_3 \bar{\nu}_{\tau L}^o] N_R^o + [h_1 \Lambda_1 \bar{\nu}_{eR}^o + h_2 \Lambda_2 \bar{\nu}_{\mu R}^o + h_3 \Lambda_3 \bar{\nu}_{\tau R}^o] N_L^o + M_D \bar{N}_L^o N_R^o + h.c. \quad (17)$$

B. Tree level Majorana masses:

Since $N_{L,R}^o$, Eq.(4), are completely sterile neutrinos, we may also write the left and right handed Majorana type couplings

$$h_L \bar{\Psi}_l^o \Phi^u (N_L^o)^c + m_L \bar{N}_L^o (N_L^o)^c + h.c. \quad (18)$$

and

$$h_{1R} \bar{\Psi}_\nu^o \eta_1 (N_R^o)^c + h_{2R} \bar{\Psi}_\nu^o \eta_2 (N_R^o)^c + h_{3R} \bar{\Psi}_\nu^o \eta_3 (N_R^o)^c + m_R \bar{N}_R^o (N_R^o)^c + h.c. , \quad (19)$$

respectively. After spontaneous symmetry breaking, we also get the left handed and right handed Majorana mass terms

$$h_L [v_1 \bar{\nu}_{eL}^o + v_2 \bar{\nu}_{\mu L}^o + v_3 \bar{\nu}_{\tau L}^o] (N_L^o)^c + m_L \bar{N}_L^o (N_L^o)^c + h.c. , \quad (20)$$

$$[h_{1R} \Lambda_1 \bar{\nu}_{eR}^o + h_{2R} \Lambda_2 \bar{\nu}_{\mu R}^o + h_{3R} \Lambda_3 \bar{\nu}_{\tau R}^o] (N_R^o)^c + m_R \bar{N}_R^o (N_R^o)^c + h.c. , \quad (21)$$

	$(\nu_{eL}^o)^c$	$(\nu_{\mu L}^o)^c$	$(\nu_{\tau L}^o)^c$	$(N_L^o)^c$	ν_{eR}^o	$\nu_{\mu R}^o$	$\nu_{\tau R}^o$	N_R^o
$\overline{\nu_{eL}^o}$	0	0	0	$h_L v_1$	0	0	0	$h_D v_1$
$\overline{\nu_{\mu L}^o}$	0	0	0	$h_L v_2$	0	0	0	$h_D v_2$
$\overline{\nu_{\tau L}^o}$	0	0	0	$h_L v_3$	0	0	0	$h_D v_3$
$\overline{N_L^o}$	$h_L v_1$	$h_L v_2$	$h_L v_3$	m_L	$h_1 \Lambda_1$	$h_2 \Lambda_2$	$h_3 \Lambda_3$	m_D
$\overline{(\nu_{eR}^o)^c}$	0	0	0	$h_1 \Lambda_1$	0	0	0	$h_{1R} \Lambda_1$
$\overline{(\nu_{\mu R}^o)^c}$	0	0	0	$h_2 \Lambda_2$	0	0	0	$h_{2R} \Lambda_2$
$\overline{(\nu_{\tau R}^o)^c}$	0	0	0	$h_3 \Lambda_3$	0	0	0	$h_{3R} \Lambda_3$
$\overline{(N_R^o)^c}$	$h_D v_1$	$h_D v_2$	$h_D v_3$	m_D	$h_{1R} \Lambda_1$	$h_{2R} \Lambda_2$	$h_{3R} \Lambda_3$	m_R

TABLE II: Tree Level Majorana masses

Thus, in the basis

$$\Psi_\nu^{oT} = (\nu_{eL}^o, \nu_{\mu L}^o, \nu_{\tau L}^o, N_L^o, (\nu_{eR}^o)^c, (\nu_{\mu R}^o)^c, (\nu_{\tau R}^o)^c, (N_R^o)^c) , \quad (22)$$

the Generic 8×8 tree level Majorana mass matrix for neutrinos \mathcal{M}_ν^o , from Table II, $\bar{\Psi}_\nu^o \mathcal{M}_\nu^o (\Psi_\nu^o)^c$, read

$$\mathcal{M}_\nu^o = \begin{pmatrix} \mathcal{M}_L^o & \mathcal{M}_D^o \\ \mathcal{M}_D^{oT} & \mathcal{M}_R^o \end{pmatrix} \quad (23)$$

where

$$\mathcal{M}_L^o = \begin{pmatrix} 0 & 0 & 0 & \alpha_1 \\ 0 & 0 & 0 & \alpha_2 \\ 0 & 0 & 0 & \alpha_3 \\ \alpha_1 & \alpha_2 & \alpha_3 & m_L \end{pmatrix} , \quad \mathcal{M}_R^o = \begin{pmatrix} 0 & 0 & 0 & \beta_1 \\ 0 & 0 & 0 & \beta_2 \\ 0 & 0 & 0 & \beta_3 \\ \beta_1 & \beta_2 & \beta_3 & m_R \end{pmatrix} , \quad \mathcal{M}_D^o = \begin{pmatrix} 0 & 0 & 0 & a_1 \\ 0 & 0 & 0 & a_2 \\ 0 & 0 & 0 & a_3 \\ b_1 & b_2 & b_3 & m_D \end{pmatrix} , \quad (24)$$

$$\alpha_i = h_L v_i \quad , \quad a_i = h_D v_i \quad , \quad b_i = h_i \Lambda_i \quad , \quad \beta_i = h_{iR} \Lambda_i \quad (25)$$

Diagonalization of $\mathcal{M}_\nu^{(o)}$, Eq.(23), yields four zero eigenvalues, associated to the neutrino fields:

$$\frac{a_2}{ap} \nu_{eL}^o - \frac{a_1}{ap} \nu_{\mu L}^o \quad , \quad \frac{a_1 a_3}{ap a} \nu_{eL}^o + \frac{a_2 a_3}{ap a} \nu_{\mu L}^o - \frac{a_p}{a} \nu_{\tau L}^o, \quad (26)$$

$$\frac{b_2}{bp} \nu_{eR}^o - \frac{b_1}{bp} \nu_{\mu R}^o \quad , \quad \frac{b_1 b_3}{bp b} \nu_{eR}^o + \frac{b_2 b_3}{bp b} \nu_{\mu R}^o - \frac{b_p}{b} \nu_{\tau R}^o, \quad (27)$$

$$ap = \sqrt{a_1^2 + a_2^2}, \quad bp = \sqrt{b_1^2 + b_2^2}, \quad a = \sqrt{a_1^2 + a_2^2 + a_3^2}, \quad b = \sqrt{b_1^2 + b_2^2 + b_3^2}.$$

Assuming for simplicity $\frac{h_{1R}}{h_1} = \frac{h_{2R}}{h_2} = \frac{h_{3R}}{h_3} \equiv c_R$, that is

$$\frac{\alpha_i}{a_i} = \frac{h_L}{h_D} = c_L \quad , \quad \frac{\beta_i}{b_i} = \frac{h_{iR}}{h_i} = c_R,$$

the Characteristic Polynomial for the nonzero eigenvalues of \mathcal{M}_ν^o reduce to the one of the matrix m_4^3 , Eq.(28), where

$$m_4 = \begin{pmatrix} 0 & \alpha & 0 & a \\ \alpha & m_L & b & m_D \\ 0 & b & 0 & \beta \\ a & m_D & \beta & m_R \end{pmatrix} \quad , \quad U_4 = \begin{pmatrix} u_{11} & u_{12} & u_{13} & u_{14} \\ u_{21} & u_{22} & u_{23} & u_{24} \\ u_{31} & u_{32} & u_{33} & u_{34} \\ u_{41} & u_{42} & u_{43} & u_{44} \end{pmatrix} \quad (28)$$

$$\alpha = \sqrt{\alpha_1^2 + \alpha_2^2 + \alpha_3^2} \quad , \quad \beta = \sqrt{\beta_1^2 + \beta_2^2 + \beta_3^2}.$$

$$U_4^T m_4 U_4 = \text{Diag}(m_5^o, m_6^o, m_7^o, m_8^o) \equiv d_4 \quad , \quad m_4 = U_4 d_4 U_4^T \quad (29)$$

Eq.(29) impose the constrains

$$u_{11}^2 m_5^o + u_{12}^2 m_6^o + u_{13}^2 m_7^o + u_{14}^2 m_8^o = 0 \quad (30)$$

$$u_{31}^2 m_5^o + u_{32}^2 m_6^o + u_{33}^2 m_7^o + u_{34}^2 m_8^o = 0 \quad (31)$$

$$u_{11} u_{31} m_5^o + u_{12} u_{32} m_6^o + u_{13} u_{33} m_7^o + u_{14} u_{34} m_8^o = 0, \quad (32)$$

corresponding to the $(m_4)_{11} = (m_4)_{33} = (m_4)_{13} = 0$ zero entries, respectively.

Therefore, \mathcal{M}_ν^o is diagonalized by the orthogonal matrix

³ The relation $a b = \alpha \beta$ would yield five massless neutrinos at tree level.

$$U_\nu^o = \begin{pmatrix} \frac{a_2}{ap} & \frac{a_1 a_3}{a ap} & 0 & 0 & \frac{a_1}{a} u_{11} & \frac{a_1}{a} u_{12} & \frac{a_1}{a} u_{13} & \frac{a_1}{a} u_{14} \\ -\frac{a_1}{ap} & \frac{a_2 a_3}{a ap} & 0 & 0 & \frac{a_2}{a} u_{11} & \frac{a_2}{a} u_{12} & \frac{a_2}{a} u_{13} & \frac{a_2}{a} u_{14} \\ 0 & -\frac{ap}{a} & 0 & 0 & \frac{a_3}{a} u_{11} & \frac{a_3}{a} u_{12} & \frac{a_3}{a} u_{13} & \frac{a_3}{a} u_{14} \\ 0 & 0 & 0 & 0 & u_{21} & u_{22} & u_{23} & u_{24} \\ 0 & 0 & \frac{b_2}{bp} & \frac{b_1 b_3}{b bp} & \frac{b_1}{b} u_{31} & \frac{b_1}{b} u_{32} & \frac{b_1}{b} u_{33} & \frac{b_1}{b} u_{34} \\ 0 & 0 & -\frac{b_1}{bp} & \frac{b_2 b_3}{b bp} & \frac{b_2}{b} u_{31} & \frac{b_2}{b} u_{32} & \frac{b_2}{b} u_{33} & \frac{b_2}{b} u_{34} \\ 0 & 0 & 0 & -\frac{b_p}{b} & \frac{b_3}{b} u_{31} & \frac{b_3}{b} u_{32} & \frac{b_3}{b} u_{33} & \frac{b_3}{b} u_{34} \\ 0 & 0 & 0 & 0 & u_{41} & u_{42} & u_{43} & u_{44} \end{pmatrix} \quad (33)$$

$$(U_\nu^o)^T \mathcal{M}_\nu^o U_\nu^o = \text{Diag}(0, 0, 0, 0, m_5^o, m_6^o, m_7^o, m_8^o) \quad (34)$$

VI. ONE LOOP NEUTRINO MASSES

After tree level contributions light quarks, charged leptons[3, 4] and the two L-handed, Eq.(26) and two R-handed, Eq.(27), neutrinos remain massless. So, the initial fermion global symmetry, Eq.(1), is broken down to

$$SU(2)_{q_L} \otimes SU(2)_{u_R} \otimes SU(2)_{d_R} \otimes SU(2)_{l_L} \otimes SU(2)_{\nu_R} \otimes SU(2)_{e_R} . \quad (35)$$

Therefore, in this scenario light neutrinos may get extremely small masses from radiative corrections mediated by the $SU(3)$ heavy gauge bosons.

A. One loop Dirac Neutrino masses

Neutrinos may get tiny Dirac mass terms from the generic one loop diagram in Fig. 1, The internal fermion line in this diagram represent the tree level see-saw mechanisms, Eqs.(16-21). The vertices read from the $SU(3)$ family symmetry interaction Lagrangian

$$i\mathcal{L}_{int} = \frac{g_H}{2} (\bar{\nu}_e^o \gamma_\mu \nu_e^o - \bar{\nu}_\mu^o \gamma_\mu \nu_\mu^o) Z_1^\mu + \frac{g_H}{2\sqrt{3}} (\bar{\nu}_e^o \gamma_\mu \nu_e^o + \bar{\nu}_\mu^o \gamma_\mu \nu_\mu^o - 2\bar{\nu}_\tau^o \gamma_\mu \nu_\tau^o) Z_2^\mu \\ + \frac{g_H}{\sqrt{2}} (\bar{\nu}_e^o \gamma_\mu \nu_\mu^o Y_1^+ + \bar{\nu}_e^o \gamma_\mu \nu_\tau^o Y_2^+ + \bar{\nu}_\mu^o \gamma_\mu \nu_\tau^o Y_3^+ + h.c.) \quad (36)$$

The contribution from these diagrams may be written as

$$c_Y \frac{\alpha_H}{\pi} m_\nu (M_Y)_{ij} \quad , \quad \alpha_H = \frac{g_H^2}{4\pi} , \quad (37)$$

$$m_\nu (M_Y)_{ij} \equiv \sum_{k=5,6,7,8} m_k^o U_{ik}^o U_{jk}^o f(M_Y, m_k^o) , \quad (38)$$

E. Quark $(V_{CKM})_{4 \times 4}$ and Lepton $(U_{PMNS})_{4 \times 8}$ mixing matrices

Within this $SU(3)$ family symmetry model, the transformation from massless to physical mass fermion eigenfields for quarks and charged leptons is

$$\psi_L^o = V_L^o V_L^{(1)} \Psi_L \quad \text{and} \quad \psi_R^o = V_R^o V_R^{(1)} \Psi_R,$$

and for neutrinos $\Psi_\nu^o = U_\nu^o U_\nu \Psi_\nu$. Recall now that vector like quarks, Eq.(3), are $SU(2)_L$ weak singlets, and hence, they do not couple to W boson in the interaction basis. In this way, the interaction of L-handed up and down quarks; $f_{uL}^{oT} = (u^o, c^o, t^o)_L$ and $f_{dL}^{oT} = (d^o, s^o, b^o)_L$, to the W charged gauge boson is

$$\frac{g}{\sqrt{2}} \bar{f}_{uL}^o \gamma_\mu f_{dL}^o W^{+\mu} = \frac{g}{\sqrt{2}} \bar{\Psi}_{uL} [(V_{uL}^o V_{uL}^{(1)})_{3 \times 4}]^T (V_{dL}^o V_{dL}^{(1)})_{3 \times 4} \gamma_\mu \Psi_{dL} W^{+\mu}, \quad (79)$$

g is the $SU(2)_L$ gauge coupling. Hence, the non-unitary V_{CKM} of dimension 4×4 is identified as

$$(V_{CKM})_{4 \times 4} = [(V_{uL}^o V_{uL}^{(1)})_{3 \times 4}]^T (V_{dL}^o V_{dL}^{(1)})_{3 \times 4} \quad (80)$$

Similar analysis of the couplings of active L-handed neutrinos and L-handed charged leptons to W boson, leads to the lepton mixing matrix

$$(U_{PMNS})_{4 \times 8} = [(V_{eL}^o V_{eL}^{(1)})_{3 \times 4}]^T (U_\nu^o U_\nu)_{3 \times 8} \quad (81)$$

VII. CONCLUSIONS

We reported an updated and general analysis for the generation of neutrino masses and mixing within the $SU(3)$ family symmetry model. The right handed neutrinos $(\nu_e \nu_\mu \nu_\tau)_R$, and the vector like completely sterile neutrinos $N_{L,R}$, the flavon scalar fields and their VEV's introduced to break the symmetries: Φ^u , Φ^d , η_1 , η_2 and η_3 , all together, yields a 8×8 general Majorana neutrino mass matrix with four or five massless neutrinos at tree level. Therefore, light neutrinos get tiny masses from radiative corrections mediated by the heavy $SU(3)$ gauge bosons. Neutrino masses and mixing are extremely sensitive to the parameter space region, and a global fit for all quark masses and mixing together with the charged lepton and neutrino masses and lepton mixing is in progress.
